(57) Compounds of the formula I

are suitable for the production of pharmaceuticals for the prophylaxis and therapy of disorders in whose course an increased activity of I κ B kinase is involved.

Description

[0001] The invention relates to novel substituted beta-carbolines, a process for their preparation and use thereof as pharmaceuticals.

[0002] United States Patent 4,631,149 discloses beta-carbolines useful as antiviral, antibacterial and antitumor agents. United States Patent 5,604,236 discloses beta-carboline derivatives containing an acidic group, useful as thromboxane synthases inhibitors.

NFkB is a heterodimeric transcription factor which can activate a large number of genes which code, inter alia, for proinflammatory cytokines such as IL-1, IL-2, TNF α or IL-6. NFkB is present in the cytosol of cells, building a complex with its naturally occurring inhibitor I κ B. The stimulation of cells, for example by cytokines, leads to the phosphorylation and subsequent proteolytic degradation of I κ B. This proteolytic degradation leads to the activation of NFkB, which subsequently migrates into the nucleus of the cell and there activates a large number of proinflammatory genes.

In disorders such as rheumatoid arthritis (in the case of inflammation), osteoarthritis, asthma, cardiac infarct, Alzheimer's disease or atherosclerosis, NFkB is activated beyond the normal extent. Inhibition of NFkB is also of benefit in cancer therapy, since it is employed there for the reinforcement of the cytostatic therapy. It was possible to show that pharmaceuticals such as glucocorticoids, salicylates or gold salts, which are employed in rheumatic therapy, intervene in an inhibitory manner at various points in the NFkB-activating signal chain or interfere directly with the transcription of the genes. The first step in the signal cascade mentioned is the degradation of I κ B. This phosphorylation is regulated by the specific I κ B kinase. To date, no inhibitors are known which specifically inhibit I κ B kinase.

[0003] In the attempt to obtain active compounds for the treatment of rheumatoid arthritis (in the case of inflammation), osteoarthritis, asthma, cardiac infarct, Alzheimer's disease, carcinomatous disorders (potentiation of cytotoxic therapies) or atherosclerosis, it has now been found that the benzimidazoles according to the invention are strong and very specific inhibitors of I κ B kinase.

[0004] The invention therefore relates to the compounds of the formula I

and/or a stereoisomeric form of the compounds of the formula I and/or a physiologically tolerable salt of the compounds of the formula I,

A solution of 7-chloro-8-methoxy-9-nitro- β -carboline (460 mg, 1.66 mmol) in EtOH (25 ml) was treated with SnCl₂·2 H₂O (450 mg, 2.00 mmol). The reaction was stirred for 5 h at 65 °C and then concentrated. The crude product was chromatographed on silica eluting with a 5 to 10% methanol in chloroform gradient to provide 410 mg of 7-chloro-8-methoxy-9-nitro- β -carboline.

[0088] A solution of 7-chloro-8-methoxy-9-nitro- β -carboline (21 mg, 0.085 mmol) in pyridine (1 ml) was treated with nicotinyl chloride hydrochloride (54 mg, 0.30 mmol) and 4-dimethylaminopyridine (5 mg). After stirring at 95 °C - 100 °C for 7 h the reaction was concentrated, the residue slurried with 10% Na₂CO₃, and then chromatographed on silica eluting with a 5 % to 10% methanol in chloroform gradient to provide 4.7 mg of the title compound.

Example 82 N-(6-Chloro-9H-β-carbolin-8-yl)-3,4-difluoro-benzamide

[0089] To a cold (3 °C - 5 °C) solution of 9-amino-7-chloro-β-carboline (2.50 g, 11.5 mmol, as prepared in example 60 above) in pyridine (130 ml) was added 3,4-difluorobenzoyl chloride (1.67 ml, 13.25 mmol). The reaction was allowed to warm to RT and stirred for 20 h before diluting the reaction with water (60 ml) and 1M NaOH (15 ml). After stirring for 3 h at RT, the pH of the mixture was adjusted to 8-9 with 1 M HCl and then poured into water (250 ml). The mixture was allowed to stand for 30 min and the product was filtered to provide 3.95 g of the title compound after washing with water and drying under reduced pressure at 55 °C - 60 °C.

Example 83 6-Chloro-N-(6-chloro-9H-β-carbolin-8-yl)-nicotinamide

[0090] To a cold (3-5 °C) solution of 9-amino-7-chloro-β-carboline (1.40 g, 6.45 mmol, as prepared in example 60 above) in pyridine (72 ml) was added 6-chloro-nicotinyl chloride (1.30 g, 7.42 mmol). The reaction was allowed to warm to RT and stirred for 16 h before diluting the reaction with water (60 ml) and 1M NaOH (8 ml). After stirring for 40 min at RT, the mixture was poured into water (200 ml). The mixture was allowed to stand for 30 min and the product was filtered to provide 2.20 g of the title compound after washing with water and drying under reduced pressure at RT.

[0091] The examples in Table 1 show the structures of the prepared compounds and were prepared according to the previous examples.

Pharmacological examples

I κ B-kinase ELISA

[0092] The in-vitro assay for detecting and measuring inhibition activity against I κ B α -kinase complex by candidate pharmacological agents employs a biotinylated polypeptide spanning both Ser³² and Ser³⁶ of I κ B α and a specific antibody binding only to the phosphorylated form of the polypeptide, being either monoclonal or polyclonal (such as the commercially-available anti-phosphoserine³² I κ B α antibodies from New England Biolabs, Beverly, MA, USA, cat. #9240). Once the antibody-phospho-polypeptide complex is formed, the complex can be detected by a variety of analytical methods utilizing such as radioactivity, luminescence, fluorescence or optical absorbance. For the use of the ELISA method, the complex can be immobilized either onto a biotin-binding plate (such as Neutravidin coated plate)

and detected with a secondary antibody conjugated to HRP, or onto an antibody-binding plate (such as Protein-A coated plate) and detected with biotin-binding protein conjugated to HRP (such as Streptavidin-HRP). The level of activity can be correlated with a standard curve using synthetic phosphopeptides corresponding to the substrate polypeptide.

Experimental

[0093] I κ B α kinase complex was prepared by first diluting 10 mL of HeLa S3 cell-extracts S100 fraction with 40 mL of 50 mM HEPES pH 7.5. Then, 40% ammonium sulfate was added and incubated on ice for 30 minutes. Precipitated pellet was redissolved with 5 mL of SEC buffer (50 mM HEPES pH 7.5, 1 mM DTT, 0.5 mM EDTA, 10 mM 2-glycerophosphate), clarified by centrifugation at 20,000 x g for 15 min., and filtration through a 0.22 μ m filter unit. Sample was loaded onto a 320-mL Superose-6 FPLC column (Amersham Pharmacia Biotech AB, Uppsala, Sweden) equilibrated with SEC buffer operated at 2 mL/min flow rate at 4°C. Fractions spanning the 670-kDa molecular-weight marker were pooled for activation. Kinase-containing pool was then activated by incubating with 100 nM MEKK1 Δ , 250 μ M MgATP, 10 mM MgCl₂, 5 mM DTT, 10 mM 2-glycerophosphate, 2.5 μ M Microcystin-LR, for 45 minutes at 37°C. Activated enzyme was stored at -80°C until further use. Per well of a 96-well plate, compounds at various concentrations in 2 μ L DMSO were pre-incubated for 30 minutes at 25°C with 43 μ L of activated enzyme diluted [1:25] with assay buffer (50 mM HEPES pH 7.5, 5 mM DTT, 10 mM MgCl₂, 10 mM 2-glycerophosphate, 2.5 μ M Microcystin-LR). Five microliters of peptide substrate (biotin-(CH₂)₆-DRHDSGLDSMKD-CONH₂) at 200 μ M stock solution was added to each well and incubated for 1 hour before quenching with 150 μ L of 50 mM HEPES pH 7.5, 0.1% BSA, 50 mM EDTA, plus [1:200] antibody. Quenched kinase reaction samples and phosphopeptide-calibration standards (biotin-(CH₂)₆-DRHDS[PO₃]GLDSMKD-CONH₂, serially diluted in assay buffer) at 100 μ L per well were transferred to a Protein-A plate (Pierce Chemical Co., Rockford, IL, USA) and incubated for 2 hours, with shaking. Following 3 washes with PBS, 100 μ L of 0.5 μ g/mL Streptavidin conjugated with HRP (horseradish peroxidase) diluted with 50 mM HEPES/ 0.1% BSA, was added for 30 minutes. After 5 washes with PBS, 100 μ L TMB substrate (Kirkegaard & Perry Laboratories, Gaithersburg, MD, USA) was added and color development was stopped by adding 100 μ L of 0.18 M H₂SO₄. Absorbance signals were recorded at 450 nm. Calibration-curve standards were fitted by linear regression using a 4-parameter dose-response equation. Based on this standard curve, levels of kinase activity were calculated in order to determine inhibition activity of candidate pharmacological agents. Table 3 which follows shows the results.

Mouse heterotopic cardiac transplant model

[0094] In the mouse heterotopic cardiac transplant model across full histocompatibility barriers (BALB/c→C57BL/6 or B6/129), graft survival is typically limited to 7.3 ± 0.4 days (mean \pm SD, n0 allografts) (see for example in Hancock WW, Sayegh MH, Zheng XG, Peach R, Linsley PS, Turka LA. Costimulatory function and expression of CD40-ligand, CD80 and CD86 or in vascularized murine cardiac allograft rejection. Proc Natl Acad Sci (USA) 93, 1996, 13967-13972; and Hancock W W, Buelow R, Sayegh MH, Turka LA. Antibody-induced transplant arteriosclerosis is prevented by graft expression of antioxidant and anti-apoptotic genes. Nature Med 4, 1998, 1392-1396).

[0095] The effects of oral administration of the compounds according to examples 49 and 60 were tested using 25 mg/kg/day for 14 days, starting at transplantation in said animal model. Whereas grafts in animals receiving the carrier, methylcellulose, rejected by 7 days (6.7 ± 0.8), grafts in compound 49-treated mice survived around 15 days (15.3 ± 0.6), and grafts in those given compound 60 survived for 20 days (20 ± 1). Current immunosuppressive therapies used in transplantation have limited efficacy and/or considerable toxicity. Targeting of I κ B-kinase with these agents significantly prolonged allograft survival without associated toxicity.

INCOMPLETE SEARCH
SHEET C

Application Number
EP 00 12 5169

Claim(s) searched incompletely:
1-3,8,9,19

Reason for the limitation of the search:

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claim(s) may be said to define subject-matter for which protection might legitimately be sought (Article 84 EPC). For these reasons, a meaningful search over the whole breadth of the claim(s) is impossible. Consequently, the search has been restricted to:

the compounds of claims 4-7, their preparation (claim 8) and pharmaceuticals containing such compounds (claim 19) and the use of beta-carbolines as defined in claims 10-18.
